Background & Objective

- Patients with uncontrolled type 2 diabetes face complex challenges managing blood glucose and lifestyle behavior.
- Technology packages have improved clinical outcomes by allowing remote patient monitoring of glucose (Glooko®) and behavioral health risks (My Own Health Report, MOHR).
- However, adoption has been limited in primary care.
- **How the method used in this project relates to planning pragmatic research:** as acceptability to key stakeholders is an overarching predictor of adoption, we sought to evaluate the acceptability of Glooko/MOHR among key stakeholders: patients and clinicians.

Overview: 60-day pilot RDM program

Methods

- We enrolled patients with uncontrolled type 2 diabetes mellitus (Hemoglobin A1c >8%) and their treating clinicians from three academic primary care clinics.
- Acceptability was rated after a demonstration of the process of sharing Glooko/MOHR data between patients and clinicians.
- All quantitative data are reported as mean ± SD.
- **We considered survey ratings of 70-80% and >80% as moderately and highly acceptable, respectively.**

Results

Figure 1: Demographic Information of the Clinicians (PharmDs & PCPs) & Patients

Glooko Perceived Usefulness: Understanding patterns in high/low glucose; Promotes accountability
 "I'm hoping that I will get a better handle on how to gauge my own blood sugar and kind of things that I do or don't do that affects it and what I can do to change and get it more into normal limits. Decrease the highs."

Figure 2: Patient Acceptability of Sharing Glooko and MOHR data

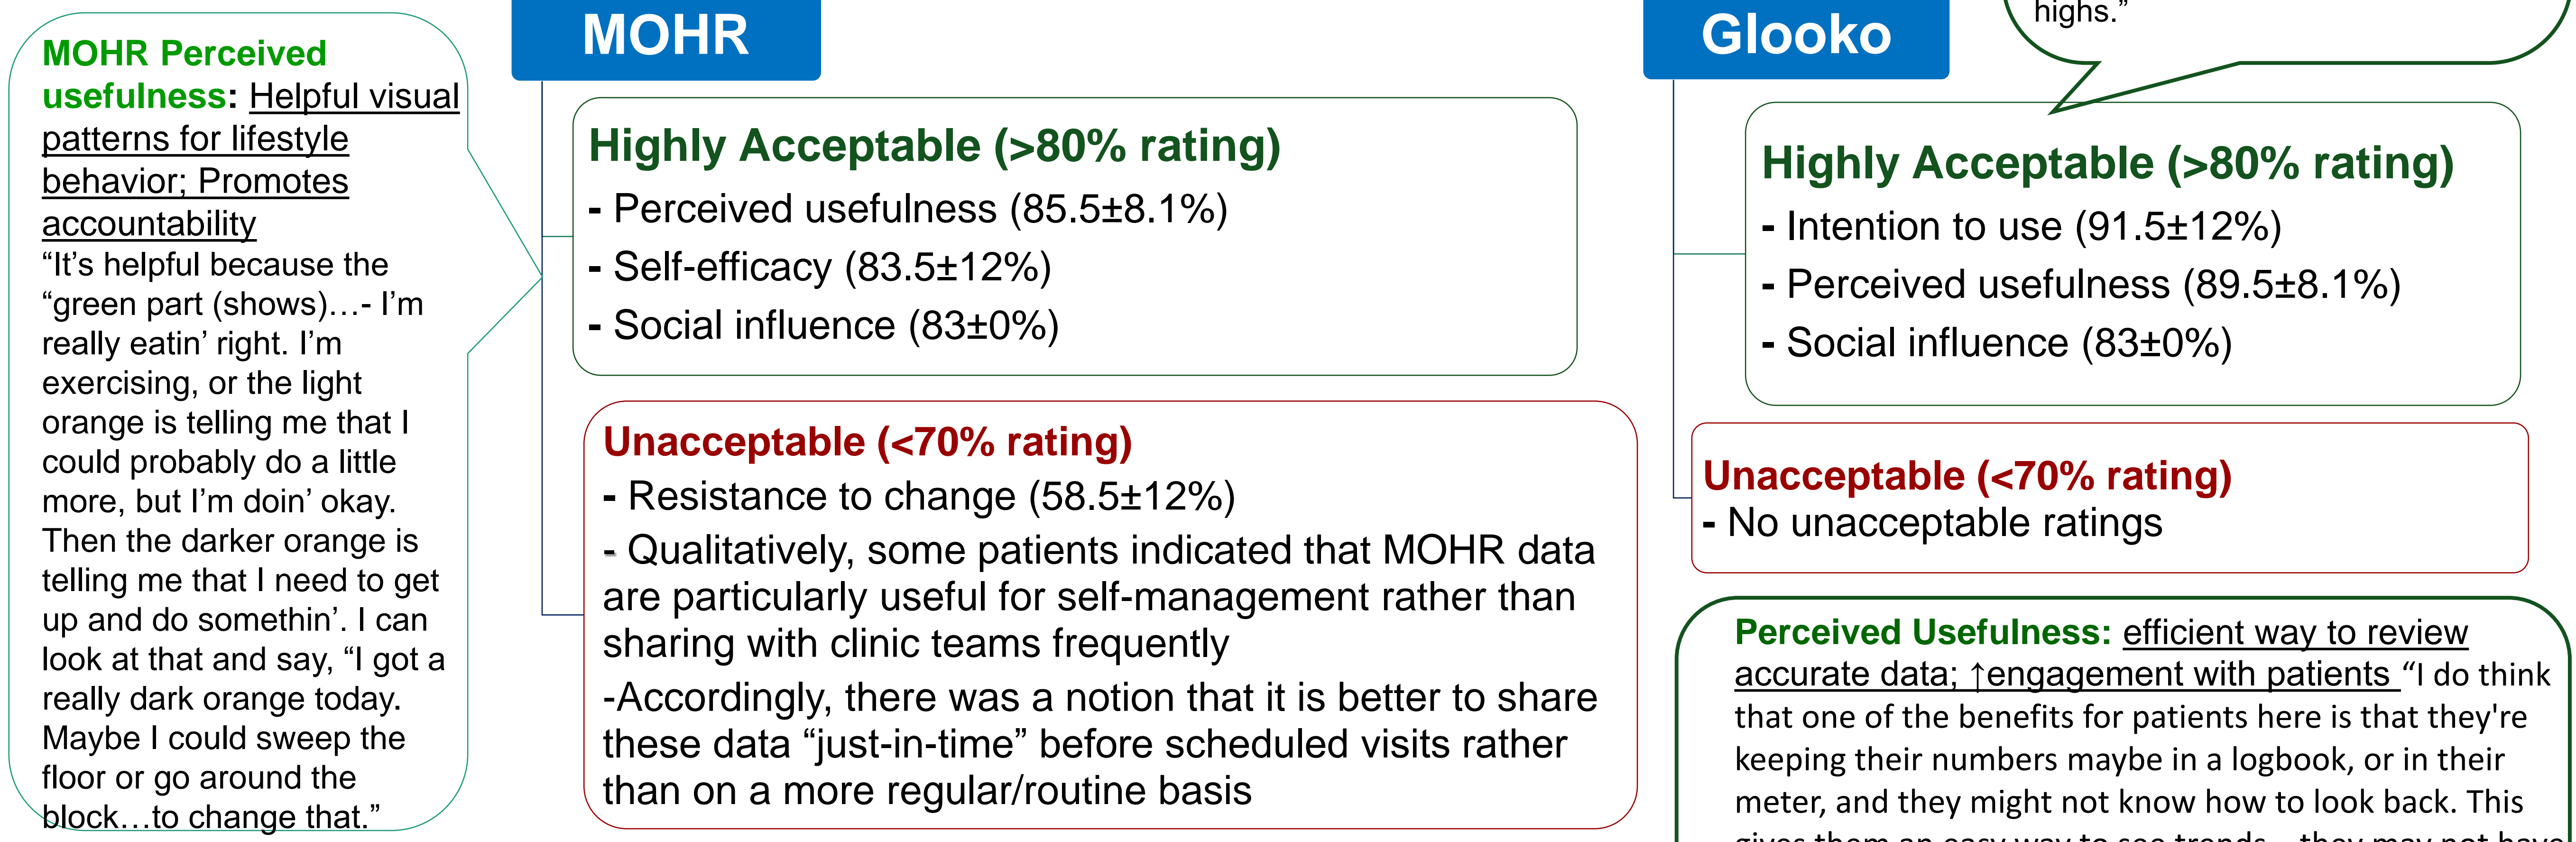

Figure 3: Clinician Acceptability of Sharing Glooko and MOHR data

**Acceptability for each domain is reported as the percentage of respondents (mean ± SD) who reported agreement with statements regarding how the RDM technology is acceptable within this TAM domain

Discussion

- Main findings:**
- The perceived usefulness of technology to share glucose and behavioral risk data between visits was rated as highly acceptable by patients and clinicians.
 - To reach the promise of using remote technology and patient-reported data to address health challenges:
 - Patients may prefer sharing behavioral risk data with clinics just prior to clinic visits than on a routine basis
 - Clinics will need to address factors causing perceptions of limited support from patients and staff, including ensuring "technical" staff are sustainably supported to troubleshoot purely technical issues.
- Limitations:**
- This project required integrating Glooko® and MOHR data with the electronic health record.

Future Directions

- The Technology Acceptance model offers insights as to the aspects of technology-based interventions that are and are not acceptable to staff and patients.
- To promote stakeholder buy-in for these remote data monitoring approaches, implementation strategies need to address these acceptability concerns
- A value proposition to stakeholders should highlight the greater patient engagement and motivation we observed

Conflict of Interest Disclosure

- No relevant conflicts of interest – this work was funded by the University of Colorado Data to Value initiative – employees of Glooko and My Own Health Report assisted with data integration but had no role in study design or data analysis.
