

Principles, Methods, and Systems for Designing for Dissemination, Sustainability, and Equity

Bethany M. Kwan, PhD, MPSH

Associate Professor and Associate Vice Chair for Research, Department of Emergency Medicine

University of Colorado School of Medicine

Adult & Child Center for Outcomes Research & Delivery Science (ACCORDS)

Learning Objectives

Upon completion of this session, participants will be able to:

1. Describe the principles of Designing for Dissemination, Sustainability, and Equity (D4DSE): beginning with the end in mind, ensuring innovation-context fit, and planning for active dissemination
2. Identify frameworks and methods useful for designing and disseminating a range of research products from a D4DSE perspective
3. Describe the phases of the Fit to Context Framework for D4DSE

Barriers to Dissemination and Sustainability

Poor fit between health innovations and intended context for use

Research paradigms used to develop and test programs

Cultures and systems that fail to incentivize and support active dissemination and translation of evidence into practice

Designing for Dissemination and Sustainability (D4DS)

- Principles and methods for:
 - Enhancing the fit between a health program, policy, or practice and the context in which it is intended to be adopted
 - Early and active dissemination and sustainability planning.
- Designing for dissemination
 - the process of ensuring that the products of research are developed to match the contextual characteristics of the target audience and setting for intended use
- Designing for sustainability
 - early planning and design processes designed to increase the likelihood of sustainment of an evidence-based program or practice after initial implementation

Designing for *Equity*

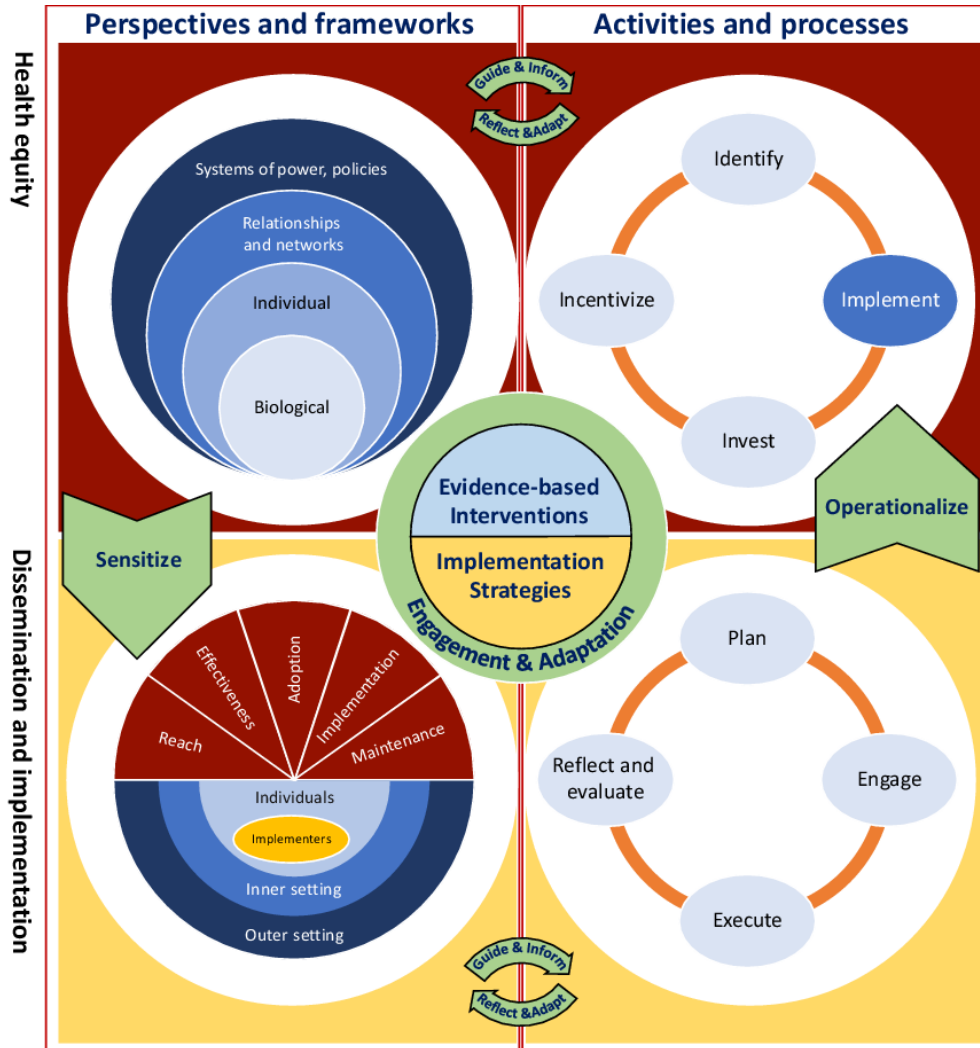

Fig. 2. Extended representation of EQ-DI framework of the interaction between health equity and D&I.

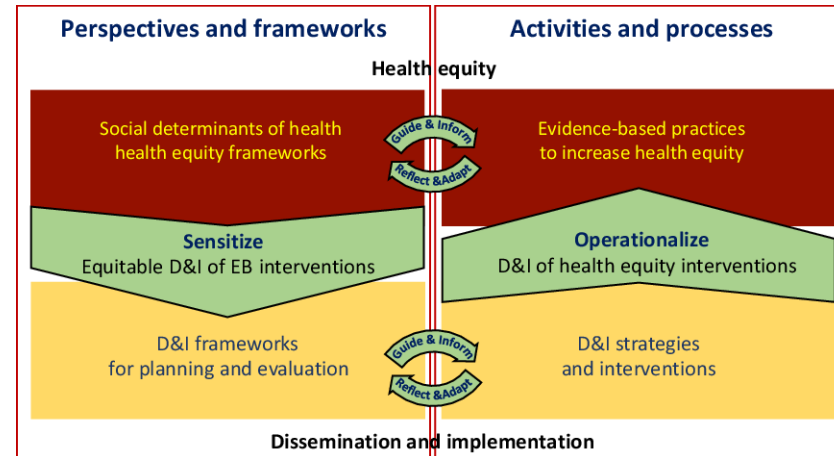

Fig. 1. EQ-DI framework on the interaction between health equity and D&I.

Advancing health equity through CTSA programs: Opportunities for interaction between health equity, dissemination and implementation, and translational science. *Journal of Clinical and Translational Science*, 4(3), 168-175. doi:10.1017/cts.2020.10

The Products of Research: “Innovations”

Evidence

- The generalizable knowledge resulting from the conduct of research and evaluation

Programs, Treatments, Interventions, and Services

- Health promotion and/or disease prevention or educational programs, interventions, initiatives, treatments, or services

Technology and Infrastructure

- Devices, software, hardware, web-based and other tools and equipment for disease prevention or management, research, evaluation, or educational purposes

Dissemination and Implementation Strategies

- Methods, approaches, guides, or materials, for dissemination, implementation, and sustainment of effective, equitable, and efficient public health and health care practices in real world settings

Policy and Guidelines

- Local and/or national public health and health care guidelines, standards, and policies emerging from the evidence base

Methods

- Research and evaluation techniques, instruments, tools, models, measures and/or equipment

What is being designed for dissemination, sustainability, and equity?

Principles of D4DS

- Beginning with the end in mind
- Ensuring innovation-context fit
- Planning for active dissemination and sustainment

Dissemination

An active approach of spreading evidence-based interventions to the target audience via determined channels using planned strategies

Diffusion curve

Planning for Active Dissemination: Six-Step Dissemination Framework

1. Describe the innovation, rationale, and evidence base
2. Identify the target audience and the sequence, timing, and format for dissemination
3. Select the communication channels
4. Determine the role of key policymakers and partnerships
5. Identify the barriers and facilitators for dissemination
6. Research and evaluate the dissemination process.

The Fit to Context (F2C) Framework for D4DS

Kwan BM, Luke DA, Adsul P, Koorts H, Morrato EH, Glasgow RE. Designing for Dissemination and Sustainability: Principles, Methods, and Frameworks for Ensuring Fit to Context. In: Brownson RC, Colditz GA, Proctor EK, eds. Dissemination and Implementation Research in Health: Translating Science to Practice, 3rd ed. *Forthcoming*.

Fit to Context

- Ensuring the products of research:
 - Are culturally appropriate
 - Can be used in resource-limited settings
 - Align with the strengths and assets of the intended audience and setting
 - Impact outcomes that matter to communities and potential adopters and influencers

Fit to Context Outcomes

- An assessment of the extent to which the research product, dissemination plan, and/or sustainability plan exhibit fit to context
 - Matches the needs, resources, workflows, and contextual characteristics of the target audience and setting
- Problem-solution fit
- Relative advantage, compatibility, complexity, observability
- Perceived acceptability, appropriateness, and feasibility
- Cultural appropriateness
- “Implementability”
- Sustainability
- Perceived usefulness and usability, user satisfaction
- Aligned with how the intended audience receives information
- Aligned with business models

D4DSE for Pragmatic Research: The Invested in Diabetes Study

- Patient and Practice Engagement
- Application of D&I Frameworks: Enhancing Replicating Effective Programs (REP)
- Enhancing Intervention Fit to Context
- Assessing Fidelity, Adaptation, Cost, and Potential Sustainability
- Planning for Active Dissemination

Research reported in this presentation was funded through a Patient-Centered Outcomes Research Institute (PCORI) Award (IHS-1609-36322). The views, statements, and opinions presented in this work are solely the responsibility of the authors and do not necessarily represent the views of the Patient-Centered Outcomes Research Institute (PCORI), its Board of Governors or Methodology Committee.

Characteristics of Pragmatic Research

- The research question of interest...
 - ...tests if an intervention is effective in routine practice or service settings, often compared to well-defined usual care or existing programs and/or other comparator interventions.
 - ...considers the setting in which the intervention will be used (and its existing personnel and infrastructure) and how the intervention will be implemented and sustained in real-world contexts

- Cluster randomized pragmatic trial (Hybrid type 2)
- Comparative effectiveness of patient-driven vs standardized diabetes shared medical appointments (SMAs)
 - SMA models use the same curriculum
 - Both are 6 sessions, about 2 hours each session
 - Models differ in terms of who delivers the curriculum (health educator vs multidisciplinary care team including behavioral health and a peer mentor) and tailoring module order and emphasis on topics to cohort needs and preferences
- Funded by PCORI Improving Healthcare Systems Award (MPIs: Kwan & Waxmonsky)
- Patient and practice representatives engaged in research prioritization, design, conduct, and dissemination

Implementation and Adaptation to Enhance Fit to Context

Enhanced Replicating Effective Programs

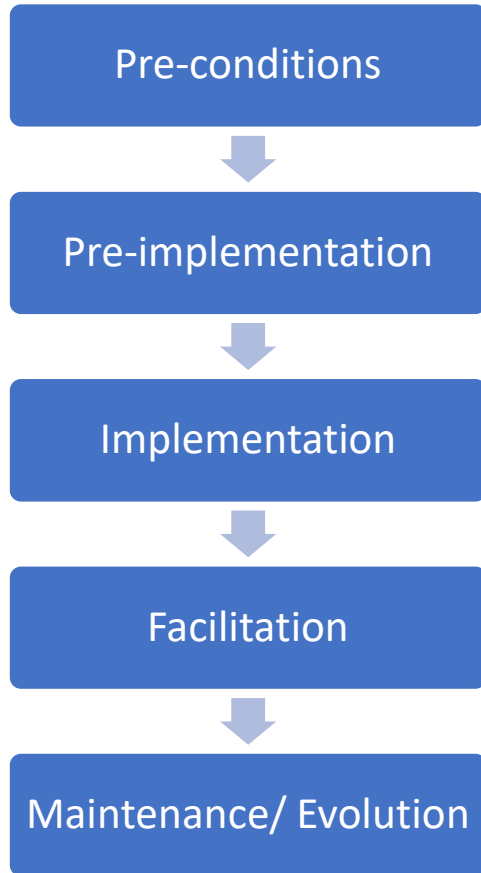

Table 5. Intervention Content, Delivery, and Training: Adaptations Fit to Context

Contextual Factors	Invested in Diabetes Practice Characteristics	Corresponding Adaptations
Data capabilities and population management	All practices had electronic health records Some had registries to help identify eligible patients Varied experience with PRO collection and use	Simplified eligibility criteria for patients (any adult with Type II diabetes, no exclusion criteria) for ease of identification Ensured PROs were relevant to clinical care and SMA discussions
Payer mix	Practices vary in payer mix, with different billing and reimbursement practices	Informed guidelines for frequency of prescribing provider visits (at every session/1st/last only etc) Provided documentation templates and common billing codes used for diabetes SMAs
Prior experience with SMAs	Some practices had prior experience delivering and billing for diabetes SMAs	Informed intensity of technical assistance, plans for process mapping; practice coaches spent more time with helping practices determine SMA workflows and staffing
Team-based care	Practice all had behavioral health Some were fully integrated with behavioral health providers and experienced with integrated team-based care; others had colocated care where the behavioral health provider operated independently of the primary care provider	Influenced plans to include behavioral health providers in trainings alongside health educators (in patient-driven condition) and adaptations to mental health and stress and coping content

- Kwan BM, Rementer J..., Waxmonsky JA. Adapting Diabetes Shared Medical Appointments to Fit Context for Practice-Based Research (PBR). J Am Board Fam Med. 2020 Sep-Oct;33(5):716-727.

Alignment with Real-World Practice

Fig. 1 PRECIS-2 ratings of the study protocol by Invested in Diabetes study team. Radar plot showing average study protocol ratings by study team on the nine PRECIS-2 domains, with points closer to center representing explanatory ratings (1) and points closer to the edge representing pragmatic ratings (5). Assessing Costs and Sustainability

Costs Associated with Implementation of Two Models of Diabetes Shared Medical Appointments

Jeanette A. Waxmonsky, PhD^{1,2} Dennis Gurfinkel, MPH¹ Natalie Ritchie, PhD^{1,4,5} Jayna DeRoeck, CDE,³ Bethany M. Kwan, PhD MSPH,^{1,2} & Mark Gritz, PhD^{3,6}

University of Colorado
Anschutz Medical Campus

RESEARCH OBJECTIVE

- Shared medical appointments (SMAs) for patients with diabetes are an evidence-based and potentially efficient approach to provide self-management education and support in a group setting.
- The Invested in Diabetes study tests two approaches to implementing SMAs (standardized vs. patient-driven).¹
- Objective:** For sustainability planning, we evaluated personnel time and cost, and other costs for starting and delivering diabetes SMAs in primary care.

POPULATION STUDIED

- Population and Study:**
- 21 of 24 primary care practices in Colorado and Kansas City randomized to one of two models for implementing diabetes SMAs. 3 practices stopped participation prior to data collection.
 - Both models included six two-hour sessions using the Targeted Training in Illness Management curriculum for groups of approximately 5-15 patients with diabetes.
 - Standardized approach is delivered by a health educator with accompanying provider visits.
 - Patient-driven approach further incorporates behavioral health providers, peer mentors (volunteer position), and patient-led topic prioritization, in response to prior feedback from patient stakeholders.

SMA IMPLEMENTATION

- Description of Cohorts and Roles:**
- Initial cohorts at each practice took between 2 and 12 months to plan (6.25 month average)
 - Cohorts reported were weekly (6 weeks), bi-weekly (3 months), and monthly (6 months)
 - Roles required to deliver SMAs were filled by various staff (see Table 1), and include paid and volunteer positions.
 - All practices attended an onboarding training. Patient-driven practices also had a peer mentor training.

REFERENCES

STUDY DESIGN

- Cost data collection and evaluation:**
- Practices were surveyed around cost using Time-Driven Activity Based Costing² methodology at two time points to collect costs for the initial start-up period (prior to first cohort), and the SMA implementation for the first completed cohort (after the last SMA for cohort).
 - Surveys asked staff hours devoted to activity groups during the two periods for each team member involved.
 - Surveys asked for other costs associated with SMAs at each time, including staff training, non-recurrent start-up expenses, materials, and overhead.
 - Staff hours are converted to costs using US Bureau of Labor Statistics mean salaries for each staff position/role. Salaries for volunteer roles were not calculated, but time is reported.
 - To account for trainer time for trainings conducted by study staff, 5 hours of staff time was added to all practices for staff training. 5 additional hours were added to patient-driven practices for peer mentor trainings. This did not vary by how many staff or peer mentors were trained.
 - Costs are broken down by start-up and implementation costs, and reported by SMA implementation model (standardized vs. patient-driven).

Table 1: SMA Roles within Practices

SMA Role	Who fills the role
Health Educator	<ul style="list-style-type: none"> Certified Diabetes Educator, Registered Dietician Program manager or coordinator (including DME coordinator) Lifestyle coach, health coach, other community health worker Registered Nurse, nurse practitioners, licensed practical nurse Care manager
SMA Coordinator	<ul style="list-style-type: none"> Medical assistant, licensed practical nurse, registered nurse Certified diabetes educator Program coordinator
Prescribing Provider	<ul style="list-style-type: none"> Physician (MD, DO) Other provider (NP, PA) Pharmacist
Behavioral Health Provider	<ul style="list-style-type: none"> Health psychologist (PhD) Social worker (LCSW, LISW) Other BHP
Roles associated with indirect support	<ul style="list-style-type: none"> Data analyst, IT professional, biostatistician Office/clinic/practice manager Administrative support staff, receptionist Outreach coordinator, site coordinator, recruiter Medical assistant, medical interpreter, patient navigator Pharmacist Registered dietitian, certified diabetes educator Chief medical officer, executive director

Table 2: Cost

	Start-up			Implementation		
	Personnel Time, hours	Personnel Cost, \$	Other Cost, \$	Personnel Time, hours	Personnel Cost, \$	Other Cost, \$
	Avg (Min, Max)	Avg (Min, Max)	Avg (Min, Max)	Avg (Min, Max)	Avg (Min, Max)	Avg (Min, Max)
Standardized SMAs	79.6 (21, 162)	\$3,420 (\$848, \$8,700)	\$957 (\$0, \$6,796)	53.4 (34.5, 100.5)	\$1,948 (\$1,085, \$3,397)	\$137 (\$0, \$615)
Patient-driven SMAs	131.1 (58, 213.9)	\$4,660 (\$1,229, \$9,877)	\$1,717 (\$0, \$7,629)	83.4 (49, 132)	\$2,430 (\$699, \$5,015)	\$177 (\$0, \$802)
All practices	102.5 (16, 140)	\$3,971 (\$848, \$9,877)	\$1,295 (\$0, \$7,629)	67.7 (34.5, 132)	\$2,177 (\$699, \$5,015)	\$156 (\$0, \$802)

- Cost Results:**
- Reported costs of delivering diabetes SMAs varied considerably among practices, both in personnel time and other expenditures. Some practices did not report any additional expenditures for the SMAs, while others reported material costs, travel, portions of facility cost etc.
 - As expected, delivering a model with a larger team involved more hours during planning and implementation than an approach with fewer personnel, plus modest increases in other costs.
 - Differences in roles involved changed cost per practice, and could affect reimbursement. Roles selected were due to a combination of staff availability and interest in SMAs, as well as scheduling decisions made at each practice.

ACKNOWLEDGEMENTS

IMPLICATIONS FOR POLICY AND PRACTICE

- Practices seeking to implement diabetes SMAs should consider:
 - Diabetes SMAs may take considerable hours to set up and implement. Roles to involve may vary based on who is available at the practice, and desired reimbursement.
 - What elements of SMAs are most important to the care of their patients, as well as providers and other stakeholders.
 - The patient-driven approach studied resulted in costs that were close to double that of the standardized approach, and require practices to have integrated behavioral health.
 - The staffing resources required relative to available funding and/or potential reimbursement for each model.
 - Average per patient costs may be lowered if practices are able to deliver diabetes SMAs to relatively larger groups.
- Reimbursement options likely vary by factors such as setting, payer mix, and credentials of personnel involved in SMA delivery. While physician visit reimbursement is more lucrative, some sites chose to utilize other provider types or not have as many prescribing provider visits due to scheduling or not wanting patients to have to pay co-pays, resulting in lower reimbursement.
- Utilizing volunteers for the peer mentor role and not considering some costs (i.e., facility cost) to be attributable to SMAs may have reduced reported costs.

CONCLUSION

- The patient driven SMAs are more expensive and resource intensive to deliver than the standardized SMAs. That said, practices seeking to implement diabetes SMAs should consider what elements of SMAs are most important to their patients and the resources required relative to reimbursement for each model.
- Time-Driven Activity Based Costing (TDABC) is an important methodology for determining implementation cost and capacity utilization of resources at the practice level for pragmatic trials.
- Future analyses will examine whether patient-driven SMAs lead to better clinical and patient reported outcomes relative to standardized SMAs.

How Might You Adopt a D4DSE Perspective in Your Research

- Change your mindset
 - Consider who will use your product, under what circumstances, and to address what urgent need – design studies to test your product IN and FOR THAT CONTEXT (yes, even efficacy trials)
 - Expect the need to pivot and adapt over time
- Enhance your skills
 - Team science!
- Build systems and infrastructure
- Incentivize dissemination beyond academic journals and conference presentations
